

GOVERNMENT OUTCOMES LAB

The upcoming projects pipeline - hackteam # 12

September 2021 - Show and Tell session - Social Outcomes Conference

@golaboxford

golab.ox.ac.uk

Levoca

Our challenge

Building upon our previous work, we wanted to design a pipeline report that could be useful for investors, outcome payers and practitioners.

What we already had:

- List of variables
- Data definitions

What we wanted to work on:

- Pipeline report
- Pipeline prototype site

What we did

1. Data collection

Hello,

Thank you in advance for your participation in this survey.

The data collected here will be used to develop a Pipeline of Impact Bond projects. We developed variables and data definitions in our March Hack and Learn. For this new edition of the event, we are looking for real cases that can provide us with data to test our prototype and see how an INDIGO pipeline of projects would look like.

This survey is being conducted by the INDIGO Initiative (International Network for Data on Impact and Government Outcomes), supported by the Government Outcomes Lab. Should you have any questions, please contact us at indigo@bsg.ox.ac.uk.

Please submit your completed survey(s) by August 21, 2021 (one per project in the pipeline). We look forward to seeing you in our final Show and Tell session, where the team working on this challenge will show their final results.

Pipeline prototype - Hack and Learn Summer 2021

2 / 2

Set background Clear frame

A clear idea of how many projects are being designed at this moment (JO)

Heat map or can we use a plant analogy? Seed = early stage, germination and root development = mid stage, seedling with small leaves sprouting above the soil = late stage (GM)

Feedback system for the target audience to give their suggestions and review of the projects. (KS)

If the project is being planned in an area, data on previous SIBs done in the area of interest and its outcome would be helpful. (KS)

Is there a checklist for each stage? (maybe the DREAM acronym that I've shared before). Then we can see what's missing for each SIB and plot a timeline to cross them off (GM)

Are the challenges to promotion between different stages documented anywhere? Challenges -> resources required -> expected timeline to move to next stage (GM)

Related - perhaps we could add detail on the confirmed status of each of the key stakeholders? e.g. who is the outcomes funder and is this confirmed? (EC)

I wonder if we could have something like the animation product Indigo produced at <https://golab.bsg.ox.ac.uk/knowledge-bank/indigo/#impact-bond-network-evolution> (IM)

Maybe each service in the pipeline could have an animation like this attached to it which would allow us to see how it is evolving towards implementation because services develop in different ways at different rates

In some cases development follows a predictable linear pattern but in other cases unforeseen circumstances impact development. A visual like this could demonstrate that, especially if additions are dated

The DREAM acronym might be a helpful framework to shape these animations which are constantly evolving. If a service isn't implemented then it might be easy to see quickly form such an animation which parts were

maybe we could combine the animation idea with the Gillians suggestion of the plant analogy - the roots might be the D of the DREAM n etc.

Also information on the agency planning the project would be helpful for the target audience. (KS)

When we click on them, I think the following info should be available: location of the project, name (even if provisory), policy sector, development challenge the project is addressing, intervention... and

I would put the data vis first, and the tables then.

Important to know the target audience's perception of project too: their expectations and involvement. (KS)

We could also prepare a table for the text variables, such as target population, name of involved orgs, etc. (JO)

Sankey diagrams look cool. Will Tableau help to create it or a different software? (GM)

We could also copy our SDG Sankey diagram and have one with the SDGs alignment of the upcoming projects. (JO)

Like the sound of the hovering feature! (GM)

If this is a paper-based report, we could have arrows coming out of the map, with a description of each project.

When you hover over these pins, you get the description of the intervention that the project will deliver.

The Google Sheet has considered the LatLong coordinates so it is ok to have a map of Israel and plot pins with the hover feature? (GM)

A map where we can see a pin where there is an upcoming project (just as we have our INDIGO map) (JO)

A heat-map with the stage of development of these projects (using a different palette of colours) (JO)

pins in a map would be really useful to allow practitioners to make relevant connections, also gives clarity on hot spots for social impact investment globally - and cold spots (IM)

A nice bar graph (or any other data vis) with the distribution of projects across policy sectors. (JO)

A heat map or can we use a plant analogy? Seed = early stage, germination and root development = mid stage, seedling with small leaves sprouting above the soil = late stage (GM)

Include here your ideas for our pipeline! What should it include? How should it be shown?

Upcoming social impact bonds

Edition 1: September 2021

Our result

Table of Contents

1. Upcoming social impact bonds across the world	3
2. Stage of development	4
3. Distribution across policy sectors	5
4. Alignment with Sustainable Development Goals	6
5. Ideas for our pipeline live dataset/website	7
6. Deep dive into interventions and other plans	8

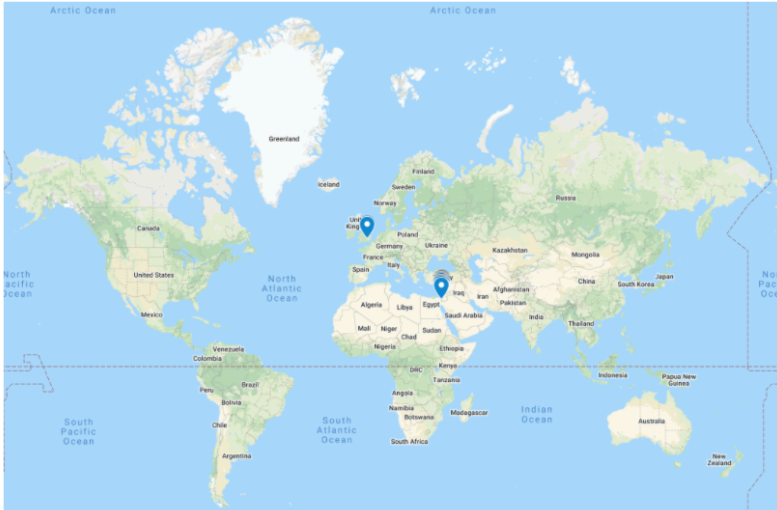

This prototype report was built using data from projects that will deliver services in Israel and the UK. Our pipeline survey will remain open for new submissions from projects worldwide.

As this is a prototype, your feedback and suggestions are welcome. Please send an email to indigo@bsg.ox.ac.uk

1. Upcoming social impact bonds across the world

There are ten upcoming projects being planned and designed in Israel and one more project in the United Kingdom.

Map 1. Distribution of upcoming impact bonds across the world

Comments:

2. Stage of development

There are 5 projects in the early stage. They may be running feasibility studies and they still need significant work. Two more projects are in the stage of final negotiations: design is almost ready but they still need to find an investor or an outcomes payer. Four projects are in the stage of final negotiations. They are almost about to sign the final contract.

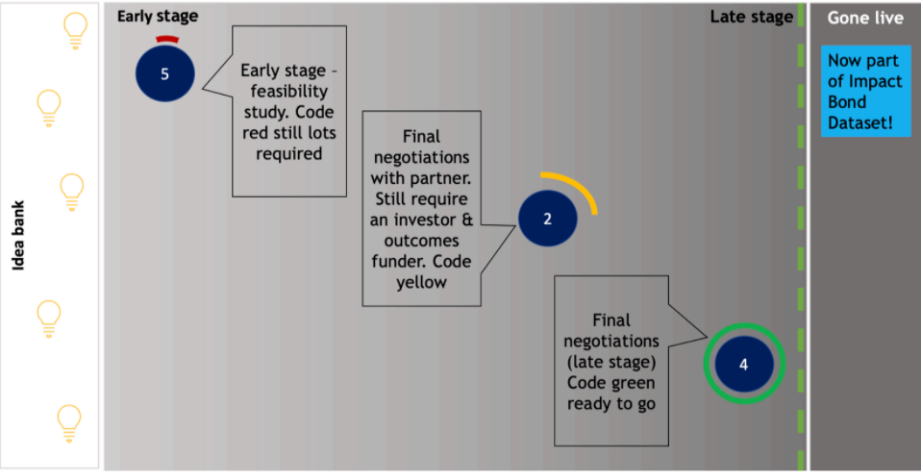

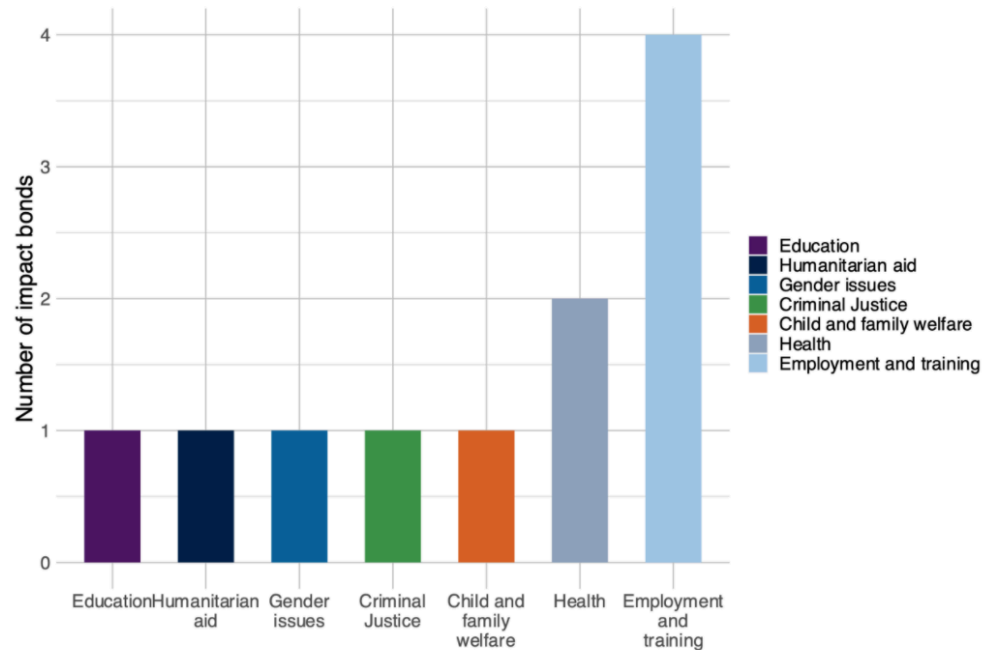

Figure 1. Stage of development of upcoming projects

GM- From the last meeting, I think we suggested using gradient shades of indigo instead of red, yellow and green

3. Distribution across policy sectors

Upcoming projects will address a variety of social challenges. There are projects related to education, humanitarian aid, gender equality and child and family welfare. Two projects will work with health issues and four projects will address employment and training challenges.

Figure 2. Distribution of projects across policy sectors

GM- This looks great. Can we use these colours to outline the tables later in the document according to their priority areas?

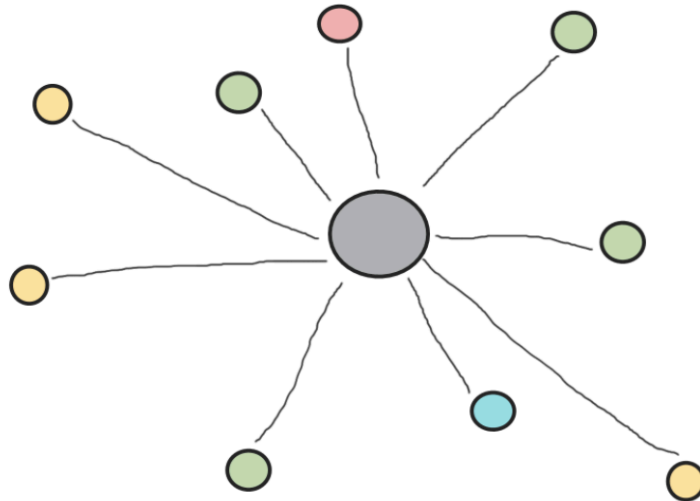

4. Alignment with Sustainable Development Goals

In terms of Sustainable Development Goals (SDGs), these upcoming projects will address SDG number 8 (work and economic growth), number 10 (reduced inequalities) and number 5 (gender equality).

Figure 3. Alignment of upcoming impact bonds and SDGs

5. Ideas for our pipeline live dataset/website

Comment: This could be the ideal completed service when it's ready to implement with the grey being the name of the service and some basic information on numbers etc drawn from the spreadsheet data, the green as investors, pink the outcome payer, yellow the provider/s and blue the intermediary.

The pipeline services could then have the different circles added as the commitments are secured so it builds up gradually to look like the template which captures the elements you must have to have a deliverable project. You could maybe add dates when new circles are added to give a sense of a time line.

In this template of the ideal the circles have a hard black border maybe the pipeline services could add a coloured circle when they have established a conversation with a potential partner and the black outline is added when the partner is confirmed.

We could have this in 3D like the indigo animation at <https://golab.bsg.ox.ac.uk/knowledge-bank/indigo/#impact-bond-network-evolution>

6. Deep dive into interventions and other plans

1. INDIGO-PIPELINE-0001: Employment promotion for single mothers

Project name	Employment promotion for single mothers
INDIGO code	INDIGO-PIPELINE-0001
Policy sector	Employment and training
Primary SDG goal	Goal 5: gender equality
Secondary SDG goal	Goal 8: decent work and economic growth
Stage of development	Final negotiations
Location:	The project aims to operate throughout Israel, but one of its goals is to make the service of quality training to the labour market accessible in the periphery as well, in light of its hybrid operating model that includes flexible / remote training and employment.
Social challenge	Exploiting the earning capacity of single mothers - increasing labour productivity and their employment rates. In addition, the project aims to address the difficulties that this population experienced as a result of the corona crisis (data in Israel show that women were affected by the crisis more than men, with single parents being particularly affected - about a quarter of the single parents who were employed before the crisis were fired)
Target population	Parents of independent families (ie single mothers and fathers) with a maximum age of the youngest child 18
Size of cohort	We expect that the project will have 800 participants, which will be divided into about 35 training groups
Description of the intervention	Hybrid training that will be performed mainly remotely, for occupations with an employment horizon that enable flexible employment (work from home, work as a self-employed person, etc.). The training will be carried out together with employers from the first stage, and emphasis will be placed on accompaniment and assistance in finding a job. In addition, the training will strengthen the search skills and job advancement of the participants, as well as work to strengthen the participants' sense of ability, and self-confidence.
Organisations already committed	They have an outcome funder (Labour branch of the Ministry of Economics) and advisor.

to this project:	
Role of domestic government:	The government, and in particular the labour arm, are the payer for the results of the project. In addition, they were a full partner in the development of the project - understanding and refining the social problem, building the intervention model and building the outcome indices and measurement model
Outcome metrics:	Increasing the salary of the participants - each participant will measure in relation to herself when we examine the increase in salary in the short term (about a year after the start of the project) and in the long term (two years after the start of the project)

2. INDIGO-PIPELINE-0002: Integration of the Arab population in high-tech

Project name	Integration of the Arab population in high-tech
Policy sector	Employment and training
INDIGO code	INDIGO-PIPELINE-0002
Primary SDG goal	Goal 8: decent work and economic growth
Secondary SDG goal	Goal 10: reduced inequality
Stage of development	Late stage (e.g. final placement)
Location:	The project will operate in selected institutions (it is not yet known which exactly) from the following list: The Hebrew University, Tel Aviv University, Ben Gurion University of the Negev, The Technion
Social challenge	Integrating the Arab population in the high-tech industry in Israel by increasing the flow of people accessing high-tech professions, reducing dropouts from higher education and assisting in finding a high-tech student job during the degree
Target population	Young Arabs who are rejected or those who are below the admission threshold for high-tech professions
Size of cohort	250 participants over 3 cohorts (about 80-90 participants in each cohort)
Description of the intervention	Accompanying participants in the first year of the degree - small study groups, marathons before exams, strengthening Hebrew and English skills, assistance in preparing for interviews and finding a student job, accessing services and rights and more. Continued accompaniment until the third year
Organisations already committed	They have an outcome funder (Labour branch of the Ministry of Economics) and and advisor.

to this project:	
Role of domestic government:	Pays for results and partner in project development
Outcome metrics:	Ending a third year with a degree in high-tech, finding a student job in high-tech

3. INDIGO-PIPELINE-0003: Childhood obesity prevention

Project name	Childhood Obesity Prevention
Policy sector	Child and family welfare
INDIGO code	INDIGO-PIPELINE-0003
Primary SDG goal	Goal 3: good health and well-being
Secondary SDG goal	N/A
Stage of development	Early stage (e.g. doing a feasibility study)
Location:	Services are expected to be provided across Israel
Social challenge	The project aims at reducing overweight/obesity rates in Israel by focusing on the early childhood years and preventative measures
Target population	The project aims at children aged 2 years old who were identified as at risk to be overweight/obese at age 5-6
Size of cohort	N/A
Description of the intervention	The intervention model is currently under design
Organisations already committed to this project:	N/A
Role of domestic government:	N/A0
Outcome metrics:	The outcome matrix is currently under design

4. INDIGO-PIPELINE-0004: Prisoner Rehabilitation/Recidivism Reduction

Project name	Prisoner Rehabilitation/Recidivism Reduction
Policy sector	Criminal justice
INDIGO code	INDIGO-PIPELINE-0004
Primary SDG goal	Goal 10: reduced inequality
Secondary SDG goal	N/A
Stage of development	Early stage (e.g. doing a feasibility study)

Moving forward

- We still need to do more work on the user experience (colours, design, etc.)
- We still need to do some work with data definitions (for instance, when do we take away a project from the pipeline? How do we archive information of old projects?)
- We could also have a site for the pipeline dataset!

Thanks!

Special thanks to Social Finance Israel!
